Professional Summary

Computer Science-Mathematics student and AI/ML Engineering Intern building computer vision, RAG, and backend systems in Python. Experienced with FastAPI, YOLO, Docker, Kubernetes, and applied ML; 2x hackathon winner.

Education

Whitman College

Bachelor of Arts in Computer Science-Mathematics

Expected May 2028

Walla Walla, WA

Experience

R-Finance

AI/ML Engineering Intern

Jun. 2026 – Present

Remote

- Built a privacy-focused FastAPI and YOLO11 computer vision service for vehicle-photo validation using fully local inference, in-memory processing, and containerized deployment.
- Improved exterior-photo acceptance from 59/80 to 71/80 on an internal holdout using quarter-turn inference fallback, recovering 12 false rejects with no regressions and recording a 4% false-positive rate on 50 manually categorized negative images.
- Built rAI_m, a RAG knowledge assistant that indexes internal documents, retrieves relevant evidence, and returns source-grounded answers through a FastAPI backend.

Bellevue College

Computer Science Teaching Assistant

Sep. 2025 – May 2026

Bellevue, WA

- Tutored 50+ students across CS 210 and CS 211 in programming, debugging, algorithms, data structures, and object-oriented programming.
- Worked one-on-one with students to diagnose logic and runtime errors and improve their approach to implementing and testing code.

Canva

AI Design & Data Storytelling Extern

Nov. 2025 – Dec. 2025

Remote

- Synthesized user research into customer journey maps, insight boards, and recommendation decks to communicate product and design findings.
- Used AI-assisted storytelling workflows to restructure information, reduce visual noise, and improve narrative flow in final presentations.

Projects

Poly Predictor Kit — 1st Place, QuackHacks 2025

GitHub

- Built a Gemini-powered market insight pipeline that processed Polymarket event data and generated concise context, probability interpretations, and risk summaries.
- Developed an Emotional vs. Rational comment classifier using Gemini-labeled data, TF-IDF, Logistic Regression, and Snowflake-backed training data.

PromptLock — LLM Context Compression Platform, NexHacks

GitHub

- Built a FastAPI and Next.js platform that transforms logs, code diffs, documentation, and API content into token-budgeted prompt packs for LLM workflows.
- Implemented four task-aware compression modes with 2K–16K token budgets, chunk prioritization, and transparency metrics for included, excluded, and prioritized context.

AI Visual Novel Creator — 1st Place AI Award, CodeDay 2025

GitHub

- Implemented an AI image-generation pipeline using Stability AI to transform structured scene descriptions into visual assets for generated stories.
- Integrated generated assets with a Python content pipeline and Ren'Py output to automatically produce playable visual novel scenes.

Technical Skills

Languages: Python, Java, C++, JavaScript/TypeScript, SQL, Bash

AI/ML: PyTorch, TensorFlow, scikit-learn, Ultralytics YOLO, LangChain, RAG, Pandas, NumPy

Backend & Data: FastAPI, Flask, Node.js, Express, REST APIs, PostgreSQL, MySQL, Snowflake

Cloud & DevOps: AWS (EC2, S3, Lambda), Docker, Kubernetes, Helm, GitLab CI/CD, GitHub Actions, Linux

Frontend & Tools: React, Next.js, Tailwind CSS, Git, GitHub, Postman, pytest
