Professional Summary

Computer Science–Mathematics student with software engineering internship experience building Python APIs, computer vision, and retrieval-augmented generation (RAG) systems. Develops Go and TypeScript tools for reliability experiments and reproducible browser debugging.

Education

Whitman College Expected May 2028
Bachelor of Arts in Computer Science–Mathematics Walla Walla, WA

Experience

R-Finance Jun. 2026 – Sep. 2026
Software Engineering Intern *Remote*

- Built a Python/FastAPI vehicle-photo validation service with YOLO11, local inference, in-memory image processing, and Docker containerization.
- Raised exterior-photo acceptance from **59/80 to 71/80** on an internal holdout using quarter-turn inference fallback; recovered 12 false rejects with no holdout regressions and measured a 4% false-positive rate on 50 manually categorized negative images.
- Built a document-based RAG assistant with a FastAPI retrieval backend and chat interface, returning source-grounded answers from indexed internal documents.

Canva Nov. 2025 – Dec. 2025
AI Design & Data Storytelling Extern *Remote*

- Analyzed user research and translated findings into customer journey maps, insight boards, and product and design recommendations.
- Applied AI-assisted synthesis and data storytelling to organize complex findings into recommendation decks with clearer information hierarchy and narrative flow.

Engineering Projects

Faultline | *Go, OpenTelemetry, SQLite, React, Docker* Oct. 2026

- Built a Go reliability lab that injects dependency latency into isolated sample services and records baseline, fault, and recovery measurements with bounded execution and cancellation cleanup.
- Added distributed tracing, SQLite run history, and a read-only React dashboard; released a portable evidence verifier for offline inspection and comparison on macOS and Linux.

ReproSeed | *TypeScript, Node.js, Playwright* Oct. 2026

- Engineered a CLI that uses delta debugging to preserve browser failure signatures while removing unnecessary actions, then exports a standalone Playwright regression test.
- Reduced a recorded duplicate-submit reproduction from **9 to 6 steps**; required five fresh verification replays before export and checked generated tests against buggy and fixed fixtures.

Poly Predictor Kit | *Python, Gemini, scikit-learn, Snowflake* Nov. 2025
Winner, Polymarket Track – QuackHacks 2025 (team project)

- Developed a Gemini market-summarization pipeline that resolves Polymarket event data and converts market prices into probability context and risk summaries.
- Built a TF-IDF/logistic-regression comment classifier using Gemini-labeled data stored in Snowflake, with stratified train/test splitting and a saved scikit-learn inference pipeline.

Technical Skills

Languages: Python, Go, C++, C, Java, JavaScript/TypeScript, SQL, Bash
Frameworks & APIs: FastAPI, Flask, Node.js, React, Next.js, REST APIs, gRPC
AI/ML & Data: PyTorch, TensorFlow, scikit-learn, NumPy, Pandas, YOLO, computer vision, NLP, RAG
Cloud & Systems: AWS (EC2, S3, Lambda), Docker, Kubernetes, Linux, Terraform, microservices, Apache Kafka
Databases: PostgreSQL, MySQL, SQLite, Redis, MongoDB, Snowflake
Testing & Monitoring: Git, GitHub Actions CI/CD, Playwright, pytest, OpenTelemetry, Prometheus, Grafana
